

Alzheimer's disease

CAUSES OF THE DISEASE

The main cause of the disease is the deposition of the protein substance amyloid in the brain tissues. This provokes disorders of nerve connections, leads to cell death and degenerative changes in the brain matter.

WHAT CAN ACCELERATE THE DEVELOPMENT OF THE DISEASE?

Use of narcotic substances
Diabetes mellitus
Alcoholism
Smoking

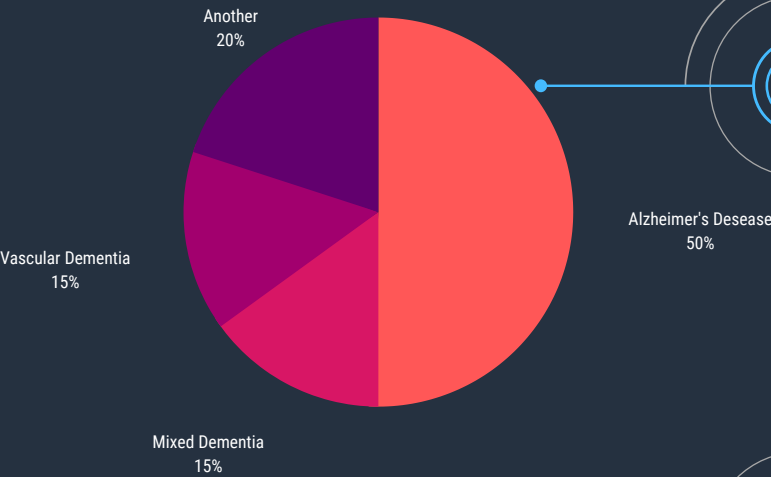

MEDICATIONS THAT EASE THE COURSE OF THE DISEASE

Antidepressants
Inhibitors
Sedatives

SYMPTOMS OF THE DISEASE

Loss of short-term memory
Speech disorder
Violation of coordination
Depression
Hallucinations

TYPES OF DEMENTIA

PATIENT SAFETY

Hide stabbing and cutting objects, household poisons and medicines.
Check the operation of the door locks, install locks on windows that the ward will not be able to open himself

TREATMENT OF ALZHEIMER'S DISEASE

Pathogenetic - Slowing down the course of the disease
Symptomatic - Reducing the severity of symptoms
